Re: Reference on MIKO-1 instrument

Dear Tatiana Olegovna,

In 2017 - 2019, our company acquired three MIKO-21 instruments, which are successfully used to measure the transition resistance of various types of high-voltage circuit breakers production by our company.

During the work, the following advantages were identified:

1. Automatic start of measurements;
2. The ability to independently adjust the current strength;
3. Ability to work on mains or battery;
4. The ability to control the device through the PC using the included software;
5. The ability to transfer and save data on the PC.

Separately, we note the comprehensive technical support of the manufacturer of the device regarding its operation.

We can confidently recommend the MIKO-21 instrument to other companies and are allowed to post a review on the skbpribor.ru website.

Regards,
Engineer for the organization of operation and repair of the
production of switching modules DB Switching equipment, LLC
