Re: Reference on MIKO-9A instrument

Since 2019, in the Ulan-Ude distance of power supply, a millimeter of MIKO-9A manufactured by SKB Electrotechnical Instrument Making LLC has been used. The MIKO-9A device is used to measure the resistance of the windings of oil and dry transformers from 0.4 to 220 kV of various types and designs.

The following advantages of this device can be distinguished:

- convenient in operation and transportation due to the small size;
- wide range of measurements fast measurement process, due to the possibility of measuring resistance across two windings;
- automatic calculations due to the archive of measurements.

During operation, no flaws were detected, the device works flawlessly.

Head of the Distance

P. A. Denisov
