### Review of MIKO-10 micro-ohmmeter operation.

Shaktinskteploenergo LLP has been using MIKO-10 manufactured by SKB EP LLC since 2020.

MIKO-10 instrument is used to measure contact resistance of the main circuit of VMP1-10, МКР-110, МКР-35 high-voltage circuit breakers, as well as disconnectors in order to identify defects and reduce the probability of switching devices failures caused by the contact resistance increase of contacts. The instrument functionality is very simple and easy to operate, it allows you to control the main characteristics of high-voltage circuit breakers.

Convenience of the instrument operation is the presence of a built-in battery, which allows you to conduct measurements independently without connecting to the network. The battery does not require frequent recharges.

The advantage of the instrument is also its mobility. The instrument copes with the tasks perfectly. We can recommend the instrument to all enterprises that operate, repair and conduct diagnostic of high-voltage circuit breakers and transformers.

We allow the review to be posted on the website and to be used for advertising purposes.
