Re: Reference on Instruments

We inform you that in the Korshunikhha-Angarsk distance of power supply, the MIKO-9A device arrived in the 4th quarter of 2018, and was distributed in the repair and inspection section.

The MIKO-9A instrument is used by our company to check power transformers and other transformers (type ZNOM-35). The device is very convenient to use, it is small-sized and light in weight.

The number of man-hours when working with the device decreased by three times, compared with the use of old methods of measurement.

We recommend that other organizations use the MIKO-9A deinstrument, which is a modern and very convenient device for checking electrical equipment.
