Review to MIKO-21

Our company purchased MIKO-21 microohmmeter manufactured by SKB EP, LLC in 2019.

Currently, the device is used to measure the resistance of circuit breakers contact connections, the resistance of welded and bolted connections, as well as the resistance of tips of molded wires.

During its operation, MIKO-21 proved to be a reliable and multifunctional device.

There are several positive aspects that have been revealed: the device is easy to use, has a convenient operating menu. Furthermore, the device has a wide range of manually set test current values and the ability to transfer measurement results to the PC. We would also like to mention the touch-screen multi-color display, the archive of passport values of the diagnosed equipment, autonomous power supply, and small weight and dimensional parameters.

The device has fully proven itself in terms of operation, in requirements of accuracy and measurement speed.
