Review of MIKO 9A operation

Dear Olga Nikolaevna!

The electrical laboratory department of Primorskaya GRES, LLC has been used milli-ohmmeter MIKO-9A for the electrical equipment diagnostic since 2021.

With a help of the instrument we measure the ohmic resistance of windings in transformers and autotransformers with a voltage up to 500 kV and a power up to 250,000 kVA, electric motors of various power with a voltage up to 6 kV. Moreover, we demagnetize the magnetic system of transformers, measure the transient resistance of contacts and bolted joints.

The instrument is convenient due to its low weight and small size. A manipulating rod with special cables was purchased together with the instrument. In many cases, the use of the manipulating rod allows you to get rid of an autolift.

The managers of Primorskaya GRES, LLC thanks SKB EP, LLC for manufacturing the necessary instrument for enterprise and hopes for the emergence of new developments. We recommend to other companies showing interest in the instruments produced by your company.

Chief Engineer

E.S. Antovshchuk
